

Teleangiectazja uogólniona Kod Orpha: 280774 Kod OMIM:

Opis choroby *

Definicja

A rare skin disease characterized by widespread cutaneous telangiectases usually first appearing on the lower limbs and slowly progressing upwards to involve the trunk and arms. The lesions can be diffuse, localized, macular, plaque-like, discrete, or confluent. Recurrent bleeding from the skin and mucous membranes is not a common feature. Likewise, co-existing epidermal or dermal abnormalities, like atrophy, depigmentation, or purpura, are absent. The condition is non-hereditary, and to establish the diagnosis, other primary and secondary telangiectases must be excluded.
