

Opis choroby *

Definicja

A rare systemic autoimmune disease characterized by acute onset of life-threatening thromboses in three or more organs either simultaneously or within less than a week, in the presence of serum antiphospholipid antibodies (such as lupus anticoagulant, anticardiolipin antibodies, and anti-beta2-glycoprotein 1 antibodies), and with histopathological confirmation of small-vessel occlusion in at least one affected organ. The condition occurs in a small subset of patients with antiphospholipid syndrome, often precipitated by infection, trauma, or surgery.
