

Opis choroby *

Definicja

A rare spotted fever rickettsiosis caused by infection with the tick-borne bacterium *Rickettsia conorii*, characterized by the onset of fever after an incubation period of about a week, followed by a centripetally spreading maculopapular rash, which may evolve into a petechial form. Accompanying symptoms are headaches, myalgia and/or arthralgia, among others. The typical "tache noire" may be observed at the site of the tick bite for several days. The disease is endemic in Africa, Southern Europe, and India.
